TITLE OF INVENTION: EXPRESSION OF MICROBIAL PROTEINS IN PLANTS FOR PRODUCTION OF TITLE OF INVENTION: PLANTS WITH IMPROVED PROPERTIES
FILE REFERENCE: 38-10(52052)A
CURRENT FILLING DATE: 2002-02-21
NUMBER OF SEQ ID NOS: 47374
SEQ ID NO 46474
LENGTH: 1611
TYPE: DNA
ORGANISM: Schizosaccharomyces pombe
US-60-360-039-46474
TYPE: DNA; ORGANISM: Human US-10-027-632-213202
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     рь

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence represents a protein from Streptococcus pneumoniae. CC The nucleic acid sequence encoding the Streptococcus pneumoniae protein cc can be useful in vaccines for inducing protective antibodies against Streptococcus pneumoniae, for treatment or prevention of infection e.g. C pneumonia, otilis media or meningitis. Probes based on the nucleic acid are used to detect Streptococcus infection (by usual hybridisation or C amplification methods), also for isolating Streptococcus genes or their C allelic variants. The protein can be used similarly to detect specific antibodies in standard immunoassays, especially for diagnosing or monitoring infections. Antibodies which bind the protein are used to C detect corresponding antigens, to purify the protein and for passive c immunisation (optionally coupled to a toxin). Vaccines are administered, c.g. by injection, orally or through the skin, typically at 0.01-1000 c (especially 10-300) mu g/ml per dose.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence is a soluble variant of the S. pneumoniae penicillin binding protein (PBP) 1A, which lacks the 1st 38 amino acid residues of the wild type protein. Wild type PBP is a bifunctional protein, which binds the cell membrane when expressed in a bacterial cell, having transglycosylase and transpeptidase activities. The variant protein (NCIMB 40665) in conjunction with a labelled anti-bifunctional PBP monoclonal antibody, can be used to identify and assay for cpds. Which bind bifunctional PBP. Such cpds., as inhibitors of bifunctional PBP have a potential use in therapeutic cpds. Which inhibit the growth of antibiotic resistant bacteria. The soluble variant may also be used in X-ray
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              transglycosylase; transpeptidase; identiantibiotic resistant; bacteria; soluble X-ray crystallography; determination.

The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein.

Note: The sequence data for this patent did not form part
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, Pseudomonas aeruginosa and Enterococcus faecalis. The invention is also useful for the identification of potential new targets.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       of the printed specification, but format directly from WIPO at

                                                                                                                                                                 used for simultaneously diagnosing pneumococcal meningitis and identifying any antibiotic-resistant S. pneumoniae strains in a sample. The methods can be used for detecting S. pneumoniae strains resistant to antibiotics, e.g. beta-lactam antibiotics, preferably penicillin. The assays can be adapted to detect other pathogens causing meningitis. The assays can be used to detect an antibiotic resistant strain of S. pneumoniae with a minimum inhibitory concentration (MIC) of 0.25-1 micro g/ml where the PCR products detected are a 1043 bp and a 224 bp product. The present sequence represents a Streptococcus pneumoniae pbpla transpeptidase encoding region (TER) isolate protein
                                                                                                                                                                                                                                                                                                               A polymerase chain reaction (PCR) assays have been developed for detecting an antibiotic resistant strain of Streptococcus pneumoniae using primers based on the penicillin binding protein 2B (pbp2B) gene and the pbp1A gene. The products and methods can be used for detecting 5. pneumoniae, particularly antibiotic-resistant strains. They can be
                                                                                                                             Sequence

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discover antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coll, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, Pseudomonas aeruginosa and Enterococcus faecalis. The
                                                                                                                                                               New polynucleotides for the identification and development antibiotics, comprise sequences of antisense nucleic acids

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      to identify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used

                                                                                                                                                                                                                                                                        This sequence represents exp2. The DNA encoding this sequence is identical to that for ponA which encodes penicillin-binding protein lA (PBPla). This sequence is involved in adhesion of bacteria to target cells. This sequence is an exported protein of S.pneumoniae. Export proteins are the proteins in pathogenic bacteria that are virulence determinants. Other export proteins include plpA (see AAR70152), expl., exp3, and pad1 (encoded by the sequence shown in AAR083259). This sequence can be inserted into an expression vector (preferrably a bacterial expression vector) to provide for high levels of expression of the protein. The protein can then be used in the protection from a cellular vaccine. These vaccines are used to provide protection from Gram positive bacterial infection. Antibodies against export proteins can be used for diagnosis of infection and in passive immune therapy.
                                                                                                                                                                                                                                                       Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel gene fragments encoding specific bacterial exported - specifically of S. pneumoniae, useful as vaccines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    WPI; 1995-115448/15.

                                                                                                                                                                                                                         AAU03601-AAU03722 represent Group B Streptococcus (Streptococcus aggalactiae) amino acid sequences of the invention. S. aggalactiae is an encapsulated bacterium which is a major pathogen of humans causing sepsis and meningitis in neonates as well as adults. The S. agalactiae antigenic polypeptides are used to vaccinate against Group B Streptococcus infections, particularly to prevent infection in new born children arising from the maternal genital tract. An immunogenic composition is useful in the preparation of a medicament for the treatment or prophylaxis of Group B Streptococcus infection. The invention does not have the disadvantages of varied response rate associated with prior art capsid polysaccharide vaccination against Group B Streptococcus.
                                                                                                                                                                                                                                                                                                                                                                                                                  New polypeptides derived from Streptococcus agalactiae are useful to provide detection of, and vaccination against, Group B Streptococcus infections, particularly to prevent infection in neonatals
                                                                                                                                                                                                    Sequence

          The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, Pseudomonas aeruginosa and Enterococcus faecalis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins.
                                                                                                                                                                                                                                                                                                                                                                                                  21-MAR-2000;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Run on:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Claim 14; Pages 780-781; 1145pp; English.

This sequence is a H. pylori protein of unspecified function.

The protein may be used in a vaccine to prevent or treat H. pylori compounds, infection or to identify H. pylori polypeptide binding compounds, cuseful as potential H. pylori life cycle activators or inhibitors. The CDNA and probes derived from it may be used for the identification of card sequences complementary to the DNA act as antisense sequences and can be used to prevent the translation of H. pylori mRNA. Antibodies against the protein can be used in immunoassays to evaluate the abundance and itstribution of H. pylori-specific antigens. The genomic sequence of H. pylori (ATCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions can development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR camplification for recombinant polypeptide production, e.g. in E. coli

Sequence 660
